

Plugin

List of third-party plugins that Phoenix uses

Simple approach(without npm)

Place your new plugin in `public/vendors` folder. Eg: to add the `flatpickr` plugin, we will download it from [here](#), unzip it and place the `flatpickr-master` folder in `public/vendors` folder. You can now simply link the plugin files to your HTML and use them.

Using npm

Suppose we are installing the `flatpickr` plugin. Here are the steps:

Step 1:
run npm command for install plugin. for `flatpickr` we can run

```
npm i flatpickr
```

Step 2:
Go to `vendors.json` file and give the path directory from node_modules as follow

```
"flatpickr": {
  "src": ["dist/flatpickr.min.js", "dist/flatpickr.min.css"],
  "dest": "flatpickr"
}
```

Here, `dest` refers to `public/vendors/`, where gulp will copy files from the `flatpickr` plugin. We actually use the `vendors` folder to store neccassary plugins. And all the plugins folder name will be as we give the dest value

Step 3:
Run the following command:

```
gulp vendor:move
```

Built-in plugins

Anchor.js

A JavaScript utility for adding deep anchor links to existing page content. AnchorJS is lightweight, accessible, and has no dependencies.

[Full Documentation](#)

CountUp

CountUp.js is a dependency-free, lightweight JavaScript class that can be used to quickly create animations that display numerical data in a more interesting way.

[Full Documentation](#)

Day.js

Day.js 2KB immutable date-time library alternative to Moment.js with the same modern API.

[Full Documentation](#)
